

DraftGem

A skill game for people
who know crypto.

- Daily fantasy, built for Solana Mobile.
- Draft 5 coins. Beat the field. Get paid on-chain.
- CLOCK IN — Solana Mobile Hackathon · Solana mainnet

DraftGem

Crypto knowledge has no scoreboard

- Millions of people follow the market, study tokens, spot trends – but there's no fun, low-stakes way to prove it against other people.
- Real trading means real exposure: you need capital, and a wrong call costs you the position.
- Fantasy sports solved this for sports fans 20 years ago: a fixed entry, a scored roster, a prize pool. Crypto never got its version – especially not one built for a phone, with a crypto-native wallet from the start.

DraftGem: Daily fantasy for crypto

- Pick 5 Solana coins within a fixed budget. Enter a tournament. Watch the standings move live. Get paid automatically when it ends – straight to your wallet.
- Your score is just the sum of your five coins' real price moves. No dice, no house edge on the outcome – only what the market actually did.
- Built mobile-first for Solana Mobile, signed end-to-end with Mobile Wallet Adapter.

Skill decides the outcome. Not chance.

- Every score is a deterministic function of real market prices, computed on-chain from attested, verifiable data – never a random number.
- Winning takes research and judgement: reading volatility, balancing a fixed budget across five picks, picking the right tournament format. That's the same skill-vs-luck test that lets fantasy sports operate as a game of skill in most jurisdictions – DraftGem applies that exact model to crypto.
- No pooled jackpot, no lottery mechanic. A fixed entry fee, a transparent prize structure shown before you play, and a program that pays out exactly what it promised.

Five picks. One budget. Real trade-offs.

- Every coin costs Fantasy Points (FP), priced by how much it actually moves – calm coins are cheap, wild ones are expensive.
- Hold 100 FP · Farm 300 FP · Pump 650 FP
· Moon 1,000 FP · Degen 1,600 FP
- You get 4,000 FP for 5 coins – so an all-Degen roster is mathematically impossible, and an all-safe roster rarely wins.

Join the lobby. Or run your own.

- A new tournament opens all the time – 1, 6, 12 or 24-hour rounds.
- Public or private: create your own and share a link to play only with friends.
- Pick a prize structure before you enter: Top 1 winner-take-all, Top 3, top 30%, top 50%, or a 1-v-1 PvP duel.

Scored on-chain. Paid on-chain.

- Each coin's result is its real % change from start to end, floored at -100% per coin so one rug can't sink you worse than one full slot.
- Your score is the sum of your five coins.
- The Solana program computes every score itself from recorded prices and sends prizes straight to winners' wallets — no manual payouts, nothing to claim from a person.

No time to think? Let the AI draft it.

- One tap opens a risk slider – Steady → Careful → Balanced → Bold → Moonshot – and an AI model builds a 5-coin portfolio for that risk level, with a one-line reason for every pick.
- Built on Google AI Studio / Gemini's free tier, with a fallback model chain so it keeps working even under rate limits.
- Nothing the model says is trusted blindly: every answer is validated on the server – five distinct real coins, total cost inside the 4,000 FP budget – before it ever reaches you.

Built around SKR, Solana Mobile's own token.

- SKR is the default currency: the automatic hourly tournaments run in SKR, it's the first choice when you create your own, and your SKR balance sits right in the header.
- Entry fees, prize pools and payouts are real SPL-token transfers, handled entirely by the on-chain program – the app never touches your keys.
- A beta-safe fee ceiling (500 SKR, about \$10) keeps early rounds low-stakes while the game is proven out.

ORE brings a mining-native token into the draft.

- ORE is a full second currency, not a bolt-on: create a tournament priced in ORE, enter with it, and get paid out in it, exactly like SKR.
- Because ORE has its own volatility profile, it widens what a "Degen" pick can look like across the game — more variety in how a portfolio can be built.
- Same beta-safety approach as every currency: a fee ceiling (5 ORE) while the game is young.

Run a tournament. Earn every time it pays out.

- Anyone can create a tournament from the app: pick the entry fee, the prize structure, the round length, public or private.
- The creator automatically earns 5% of the prize pool, sent by the program the moment the round pays out – no manual collection.
- Creation itself costs a small fixed fee (0.005 SOL) – cheap enough to run a tournament for a Discord, a group chat, or just a few friends.

< Create Tournament

Earn 5% of every prize pool

×

You get 5% of the pool of your tournament, paid to your wallet when it pays out. The platform takes another 5%.

Currency

Native to the Seeker, not bolted on.

- Every action – connecting, entering, creating, claiming – is signed with Mobile Wallet Adapter. Your keys never touch the app.
- On a Seeker, that means the phone's own built-in wallet handles every signature, with the same native prompt every other Solana Mobile app uses.
- The whole draft-to-payout loop was designed to work one-handed, in short sessions, between everything else you're doing on your phone.

Three pieces, one loop.

- Mobile app — React Native / Expo, Mobile Wallet Adapter for every signature.
- Cloudflare Worker backend — runs the cron that prices coins, settles rounds and pays out; proxies RPC calls; talks to Google AI Studio for the AI portfolios.
- Anchor program on Solana mainnet — owns every dollar: creates tournaments, records prices, scores entries, and sends prizes. The app and backend can suggest, but only the program moves funds.
- Formats supported today: 4 currencies [SKR / SOL / ORE / USDC], 4 round lengths, 5 prize structures, public or private, single or multi-entry.

CLOUDFLARE®

Real money, deliberately bounded.

- DraftGem runs on Solana mainnet today, not a demo network.
- A self-audit pass covers every fund-moving instruction, with regression tests for the bugs it found and fixed before launch.
- Beta-stage entry-fee ceilings across every currency keep early rounds low-stakes on purpose, while the game proves itself out with real players.
